## Syntax

| Math | Eigenmath | Comment |
| :---: | :---: | :---: |
| $a=b$ | $\mathrm{a}=\mathrm{b}$ | test for equality |
| $-a$ | -a | negation |
| $a+b$ | $a+b$ | addition |
| $a-b$ | $a-b$ | subtraction |
| $a b$ | a b | multiplication, also a*b |
| $\frac{a}{b}$ | a/b | division |
| $\frac{a}{b c}$ | a/b/c | division is left-associative |
| $a^{2}$ | $\mathrm{a}^{\wedge} 2$ | power |
| $\sqrt{a}$ | sqrt (a) | square root, also a^(1/2) |
| $a(b+c)$ | a (b+c) | space is required |
| $f(a)$ | f(a) | function |
| $\left(\begin{array}{l}a \\ b \\ c\end{array}\right)$ | ( $\mathrm{a}, \mathrm{b}, \mathrm{c}$ ) | vector |
| $\left(\begin{array}{ll}a & b \\ c & d\end{array}\right)$ | ( (a, b) , (c, d) ) | matrix |
| $F^{1}{ }_{2}$ | $\mathrm{F}[1,2]$ | tensor component access |
|  | "hello, world" | string literal |
| $\pi$ | pi |  |
| $e$ | $\exp (1)$ | natural number |

Arithmetic operators have the expected precedence of multiplication and division before addition and subtraction. Subexpressions in parentheses have highest precedence.

Parentheses are required around negative exponents. For example,
$10^{\wedge}(-3)$
instead of
$10^{\wedge}-3$

The reason for this is that the binding of the negative sign is not always obvious. For example, consider
$x^{\wedge}-1 / 2$
It is not clear whether the exponent should be -1 or $-1 / 2$. Hence the following syntax is required.
$x^{\wedge}(-1 / 2)$
In general, parentheses are always required when the exponent is an expression. For example, $\mathrm{x}^{\wedge} 1 / 2$ is evaluated as $\left(x^{1}\right) / 2$ which is probably not the desired result.
$x^{\wedge} 1 / 2$
$\frac{1}{2} x$
Using $x^{\wedge}(1 / 2)$ yields the desired result.
$x^{\wedge}(1 / 2)$
$x^{1 / 2}$
